

Enterprise Risk Introduced by AI-Based Regulatory Authoring

AI-Driven Regulatory Authoring: Challenges, Solution, & Risk Landscape

AI-Driven Regulatory Authoring

Objective

Design an AI-powered regulatory authoring platform that accelerates submissions while preserving regulatory control, consistency, and audit-readiness across the product lifecycle.

Traceability state persistence

AI-driven regulatory authoring that reduces risk, not control.

Data used in demo: Clinical Data: Bells Palsy

AI-Authoring - How

This platform does not replace regulatory judgment — it operationalizes it.

How Risks Are Mitigated by Design

**AI-
Authoring –
Risk
Mitigation**

Example: How risk is minimised

- Scalable
- Privacy protected: Local hosted LLM
- Role based Control: Access based on need to know
- Least privilege Authentication: No human error
- Secret Manager: No accidental leak of data

Traditional Authoring	AI-Driven Authoring
Manual drafting across documents	AI-assisted, guided content generation
Repetitive copy-paste	CSR as reusable evidence source
High inconsistency risk	Built-in data & semantic consistency
Limited traceability	End-to-end traceability by design
High review burden	Faster review with aligned content

Risk	Your Control
Hallucination	Template + Analytical Engine
Inconsistency	Dependency Engine
Traceability	Knowledge Graph/Persistence state/validation certificate
Compliance	Validator Layer
